

Lawn Nutrition and Weed Defense Program

1. Spring Pre-Emergent (February & March): This application addresses weeds before they happen. Along with the pre-emergent herbicide application, additional post-emergent herbicides will be applied to address winter annual weeds like clover and annual bluegrass.
2. Late Spring Fertilizer (April & May): This application will get your lawn off to a great start. We will apply a timed-release fertilizer that will provide your lawn with a baseline feeding for season long performance. During this visit, agents will scout for any remaining cool season weeds and take appropriate measures to eliminate them.
3. Mid-Summer Foliar Feeding (June & July): Both macro- and micro-nutrients are essential for healthy turf. Our applications will help improve turf density, vigor, and provide a deep green color. Also, any weeds like crabgrass and dandelions will be addressed at this time.
4. Late Summer Fertilizer (Aug & Sep): A high potassium application that provides the turf the strength it needs to survive the impending winter. This application will also include pre-emergent herbicide to prevent winter weeds.
5. Fall Inspection (Oct & Nov): During this visit our agents will inspect for any remaining weeds, applying spot application if needed. Your soil will be evaluated with necessary amendments made to provide the best soil for healthy plant growth.

At Leaf to Soil we use premium products to provide superior results. Where others may apply products based on their price, Leaf to Soil applies products based on their performance. At Leaf to Soil we believe that “an ounce of prevention is worth a pound of cure.” We strive to provide our clients with results by implementing a professional plan that will meet your specific needs.
